

Mah Sing Group Berhad (8583)

Upward Parallel Channel Points to Further Gains, Breakout Emerges

MSGB MK	Last Close:	1.120	52w High	1.240	52w Low	0.925
---------	-------------	-------	----------	-------	---------	-------

Entry Price	1.120 – 1.125	Stop Loss	1.035	Target Price	1.165 – 1.235
Resistance 1	1.165	Support 1	1.010	RSI	Bullish
Resistance 2	1.235	Support 2	1.040	MACD	Positive

Technical Highlights

The stock last closed at RM1.120, continuing its upward momentum following the breakout from the falling parallel channel formed from mid-April to late July. Should the momentum persists, the stock is poised to test the nearest resistance level at RM1.165.

Momentum indicators are gradually improving. The RSI stands at 77.23, reflecting strong buying interest while approaching overbought territory. Meanwhile, the MACD remains above the signal line (with a positive histogram), suggesting that bullish momentum is gaining traction. Adding to the constructive outlook, prices continue to trade above all its key EMAs (20-, 50-, and 200-day), suggesting that the broader near-term trend remains positive while awaiting a breakout confirmation.

On the upside, the immediate target is RM1.165, with further strength potentially extending towards RM1.235 should momentum build. Conversely, a breach below its support levels would invalidate the bullish outlook and expose the stock to further downside.

Company Profile

Mah Sing Group Berhad is a property developer. The Company's principal activity is in property development where the group develops commercial, residential (both high-rise and landed) as well as industrial properties. The Group is also involved in plastic manufacturing manufacturing and trading in Malaysia and Indonesia.

Glossary of commonly used technical terms

Exponential Moving Average (EMA)	An indicator frequently used in technical analysis showing the average value of a security's price over a set period with greater weightage placed on the most recent data points.
Moving Average Convergence Divergence (MACD)	A trend-following momentum indicator that shows the relationship between two moving averages of prices. The MACD is calculated by subtracting the 26-day exponential moving average (EMA) from the 12-day EMA. A 9-day EMA of the MACD, called the "signal line", is then plotted on top of the MACD, functioning as a trigger for buy and sell signals.
Stochastic	A technical momentum indicator that compares a security's closing price to its price range over a given time period. The indicator's sensitivity to market movements can be reduced by adjusting the time period or by taking a moving average of the result.
Average True Range (ATR)	A measure of volatility whereby the indicator is the greatest of the following: - current high less the current low; - the absolute value of the current high less the previous close; - the absolute value of the current low less the previous close;
Bollinger Band	A band plotted 2 standard deviations away from a simple moving average.
On-Balance Volume (OBV)	A method used in technical analysis to detect momentum, the calculation of which relates volume to price change. OBV provides a running total of volume and shows whether this volume is flowing in or out of a given security.
Support	The price level which, historically, a stock has had difficulty falling below. It is thought of as the level at which a lot of buyers tend to enter the stock.
Resistance	The price at which a stock or market can trade, but not exceed, for a certain period of time. Often referred to as "resistance level".
Reversal	A change in the direction of a price trend. On a price chart, reversals undergo a recognizable change in the price structure. An uptrend, which is a series of higher highs and higher lows, reverses into a downtrend by changing to a series of lower highs and lower lows. A downtrend, which is a series of lower highs and lower lows, reverses into an uptrend by changing to a series of higher highs and higher lows.
Divergence	When the price of an asset and an indicator, index or other related asset move in opposite directions.
Overbought	In technical analysis, this term describes a situation in which the price of a security has risen to such a degree – usually on high volume – that an oscillator has reached its upper bound. This is generally interpreted as a sign that the price of the asset is becoming overvalued and may experience a pullback.
Oversold	A situation in technical analysis where the price of an asset has fallen to such a degree – usually on high volume – that the oscillator has reached a lower bound. This is generally interpreted as a sign that the price of the asset is becoming undervalued and may represent a buying opportunity for investors
